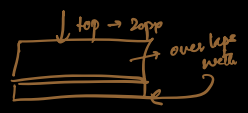
Positions in CSS

1. Static → Default value.
2. Relative
3. Absolute
4. fixed
5. Sticky

→ we can provide offsets.

position : relative
top : 10 px
left : 20 px



position : absolute;
bottom : 0 px ;
→ as per viewport, it shifts to lowest part.

{ if top : 0px — goes at top }

main {
position : relative ;
}
→ Default is viewport

position : fixed ; → not moving its place → even if we ~~mo~~ scroll, it'll be stuck at Top

bottom : 0px
2
now at bottom

position : sticky → as soon as it reaches 10px, it sticks.
top : 10 px;

Positioning the pop-up

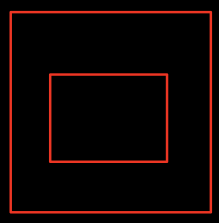
```
<body>
  < div  id = " overlay " > </div>

# overlap {
    position : relative ;
    top  : 0
    left : 0
    width : 100%
    height : 100%
    background-color : xyz }

  <div  id=" pop-up"

  # pop-up {
      position : fixed;
      width : 200px;
      height : 200px
      background-color : azure;
```

left : 30%
top : 40%
border-radius : 10px;
text-align : center
line-height : 200 px;



Z-index

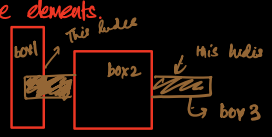
- order in which we can place elements.

box1 {
z-index : 5

box 2
z-index : 6

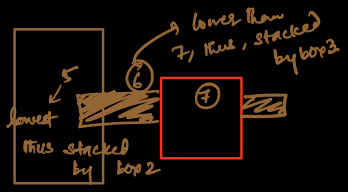
box3
z-index : 7

stacking order

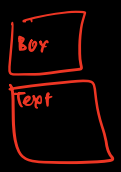


Natural-Order

It works on position elements.



Float Property



Want →

float: left → to set element to left of containing block
" " " " right " " "
inline-start
inline-end

inherit
2
from parent

box {
float: left
}

img {
float : inline-start → Text wraps around it.
}

Overflow

overflow : visible
hidden
clip
scroll
auto

 → —

default is visible

hides if overflow: hidden

overflow : clip
overflow-clip-margin: 50px

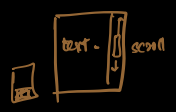
overflow : scroll

overflow-x : scroll

overflow-y : hidden

overflow : auto ;

→ usually gives scroll.

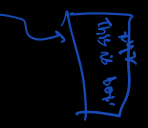


Writing Modes

Writing-mode : horizontal-tb ; → left to right.

: vertical-lr ;

: vertical-rl



sideways-rl → text laid sideways with characters rotated 90 deg clockwise.

-lr → 90 counter-clockwise.

Solution description

The value "vertical-rl" of the writing-mode property specifies that text is laid out vertically from top to bottom, with each line progressing from right to left along the right side of the container. This is commonly used in languages such as Mongolian. Options: horizontal-tb, horizontal-rl are for horizontal text layout, while vertical-lr is used for vertical text layout with the text progressing from top to bottom along the left side of the container.

CSS Sizing Techniques

img {

max-width : 100%

(If we want image to fit in a box?)

BST width : 100% ;

height : 100 %

created big box & small box → · big (height, width) · small

· cover {

object-fit : cover → cover entire container maintaining aspect ratio

contain

scale down → contain scales down to fit within container's dimensions.

→ will resize as much as possible (maintaining aspect ratio)
