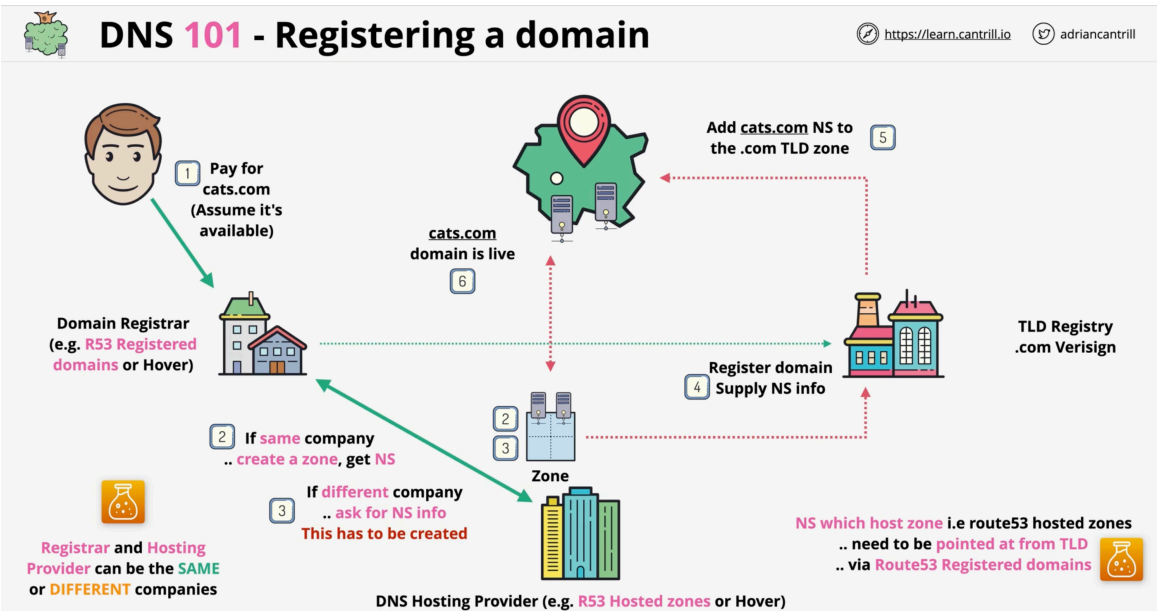
R53 ⇒ Route 53

- Registrar → one function → To let us purchase domains. To allow this they're a relationship with TLD registry for many top-level domains.

- <u>DNS Hosting Provider</u>

  → They operate DNS name servers which can host DNS zones. They allow you to manage the content of those zones.

[AWS → Route 53 registered domains area of the console, then this is the domain registrar function]

If working in DNS hosting area, this is the DNS hosting provider area.


- If the DNS hosting provider is the same company as registrar, zone is created and hosted automatically. If its a diff^t company, you'll be asked for the name server info where the zone is hosted already. This has to be configured separately.
