Whatever comes after header section is called as hero section

CSS Variables

→ colors using consistently (eg) → orange, bluish - black, green, white etc

→ can save these colors somewhere. to avoid copying-pasting.

→ also, if we want to change a particular color throughout - we can do it easily.

-- primary : # ——— ;

-- secondary : # ——— ;

These variables should be created under selectors

↓

Better to create them under root selector <html> selector

can create it anywhere → (eg)

```
hi {
  --secondary-color : "green"
}
```

```
p {
  color : var (--secondary-color)
}
```

This won't be green if p is not inside hi

Thus, better to create them as global variables.

⇒ (q)

```
a {
    text-decoration : line-through;
}

navbar a {
    text-decoration : none;
}
```
